

Identity & Access Management (IAM)

Task : Set up IAM roles and policies in a cloud provider (Azure).

IAM : Deals with preventing unauthorized access to resources.

Key components of IAM :

1. Identification
2. Authentication
3. Authorization
4. Access Management
5. Monitoring & Auditing

IAM Policies : Define rules for the user to what actions/services they can perform

IAM Roles : Predefined or Custom permission sets that control what actions users, groups, or services can perform on resources.

Like Owner : full control over resources, can assign roles

whereas Contributor : can use resources, but cannot assign roles

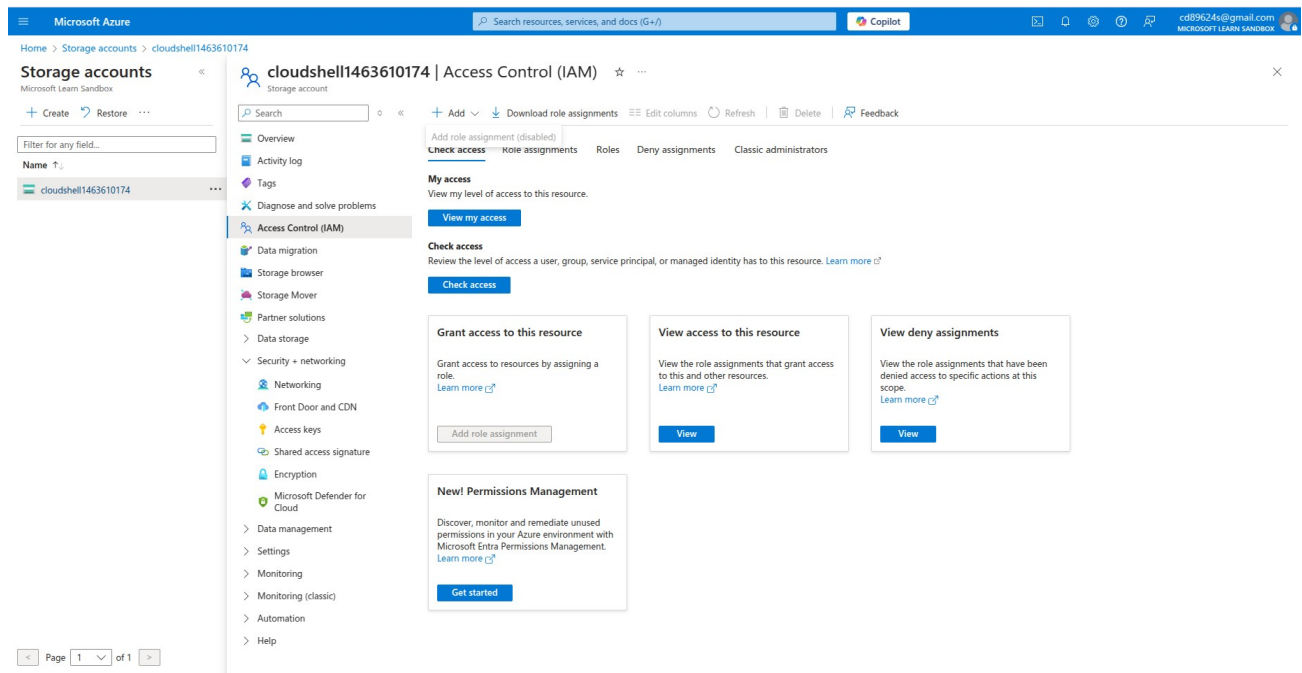

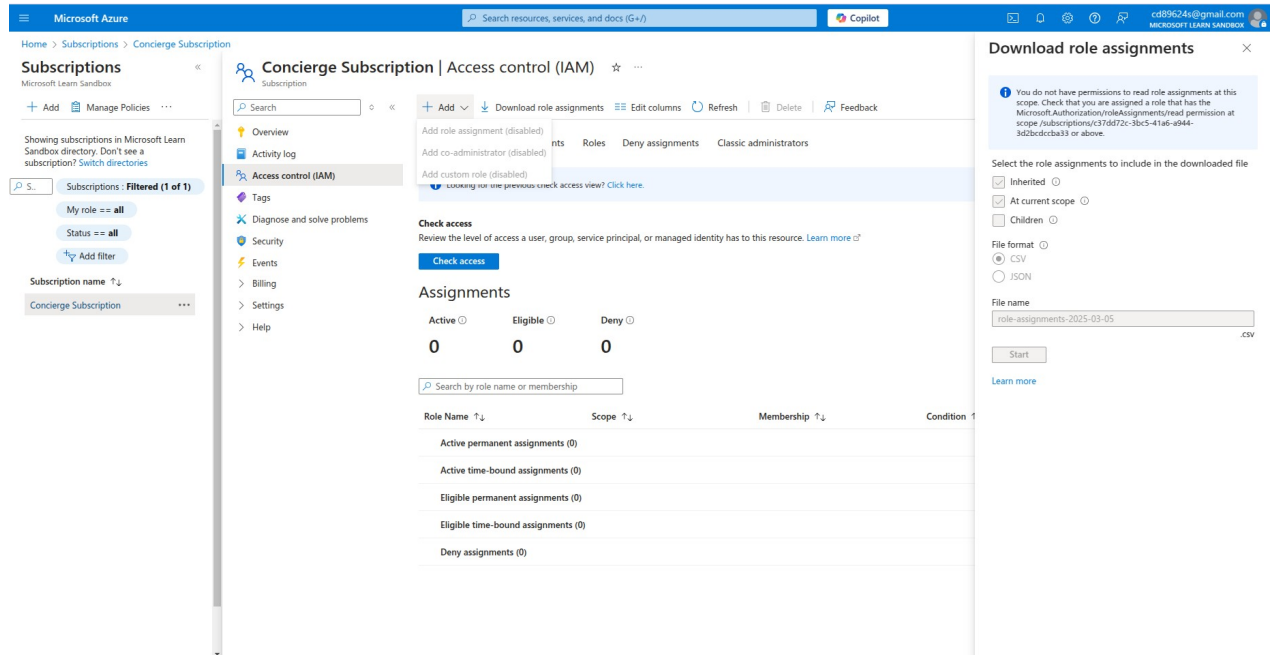

IAM Permission : Specific actions(like Read, Write, Delete etc) that a role allows on azure resources.

Multifactor Authentication : A security measure requiring multiple verification steps (eg : password/ OTP) for access.

Role Based Access Control (RBAC) : A system that grants users permission based on their role, ensuring they have only the necessary access.

Perform task with the help of Microsoft Sandbox

I tried to set up IAM roles and policies, but in Microsoft Sandbox (limited permission), we don't have the necessary access to perform these operations.
